

OSS Preflight

Turn an app idea into a ranked, evidence-backed open source starting point with a generated starter and smoke test.

3

ranked recommendations

1

Evidence Passport per package

1

generated Discord starter

134

unit tests green locally

PROBLEM

Developers lose time choosing a stack before they write useful code.

- Package choice is often driven by memory, popularity, or search ranking.
- Facts, inferred tradeoffs, and stale assumptions get mixed together.
- Even a good choice still leaves starter setup and verification work.

SOLUTION

A single honest pipeline: idea -> evidence -> scaffold -> smoke test.

Recommend

Parse the idea, collect public package facts, and rank candidates deterministically.

Explain

Show score components and separate registry facts from AI-generated inference.

Generate

Create a starter project with mocked messages and a runnable smoke test.

DEMO

The verified local demo path is ready.

- Input: `Discord bot that summarizes channel activity`
- Result: three recommendations, with `discord.js` ranked first.
- Scaffold: generated starter installs dependencies and passes its smoke test.
- Fallback: README documents the local path if no public deployment is available.

BOB EVIDENCE

Bob is part of the SDLC, not only the final polish.

Modes

Plan, Code, Orchestrator, reviewer, and scoped scaffolder modes.

Skills

Code review, evidence discipline, test runner, doc writer, Plan Council, OSS advisor.

Exports

Build ledger and session folders under [bob_sessions/](#).

TEAM + READINESS

Solo build, Bob-assisted delivery, explicit remaining submission actions.

- Team: Dreamverse Holdings solo builder with IBM Bob as the visible engineering partner.
- Green locally: `pnpm test`, `pnpm build`, and Playwright browser flow.
- Still external: missing S06/S07 Bob screenshots, demo video, final approved commit and tag.
